(a) convex g on a taxel
spread to v_1, v_2
actual
concentrate at m
v_1 x_1 m x_2 v_2
(b) $\nu^\star$ and level sets of g
true $h = 0.226$ (pure torsion)
(c) lower bound: concentrate
$\underline{h} = 0.127$, one point per taxel
(d) upper bound: spread to corners
$\overline{h} = 0.441$, 11 nonzero weights $\leq r + 2 = 11$
